To comply with Safe Drinking Water Act amendments and the Washington State Department of Health (DOH) mandates, Jefferson County Public Utility District #1 annually issues a report on monitoring performed on each of its water systems. The purpose of this report is to advance consumer’s understanding of drinking water and heighten awareness of the need to protect precious water resources. If you have any specific water system questions please feel free to contact the Mats View water system manager, Doug Reeder, at 385-8347 or 301-0708 (cell). The PUD Board meets on the first and third Tuesday of each month at 5:00 p.m. at the Jefferson Transit Authority at 63 Four Corners Road; feel free to attend. Your district is District 3 and your district commissioner is Dan Topper. Please use water wisely.

Your water comes from a single well located within a well house on Mats View Terrace Road about 1/4 mile west of the intersection with Oak Bay Road. The well is nearly 200 ft deep and is developed within coarse gravel and sand. The water system was transferred to the PUD and was originally owned by Harold Moe.

Is my water safe? In 2018, the Mats View system met all U.S. Environmental Protection Agency (EPA) and Washington State drinking water health standards.

Examples of contaminants that may affect source water include: Microbial contaminants, such as viruses and bacteria, may come from sewage treatment plants, septic systems, livestock operations and wildlife, inorganic contaminants, such as salts and metal, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic waste water discharges, oil and gas production, mining or farming, Pesticides and herbicides, which may come from a variety of sources such as agriculture and residential uses, radioactive contaminants, which are naturally occurring, and organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.

Do I need to take special precautions? Some people may be more vulnerable to contaminants in drinking water than the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbial contaminants are available from the Safe Water Drinking Hotline (1-877-481-4091).

Drinking water, including bottled water, may reasonably be expected to contain at least small amount of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA’s Safe Drinking Water Hotline (1-877-481-4091) or Sophia Petro at the State DOH (360-236-3046).
In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. We will treat your water according to EPA and State DOH regulations. Food and Drug Administration regulations establish limits for contaminant in bottled water which must provide the same protection for public health.

About the arsenic detected in your well water: Your drinking water currently meets EPA's revised drinking water standard for arsenic. However, it does contain low levels of arsenic. There is a small chance that some people who drink water containing low levels of arsenic for many years could develop circulatory disease, cancer, or other health problems. Most types of cancer and circulatory diseases are due to factors other than exposure to arsenic. EPA's standard balances the current understanding of arsenic's health effects against the costs of removing arsenic from drinking water. Low levels of arsenic were detected in your well in 2016 at a concentration of 6 ppb or 0.006 mg/l.

Lead has been detected in distribution. In 2016, two rounds of 5 samples for lead and copper were taken from randomly selected homes within distribution. 4 of the 10 samples showed the presence of lead, but all met the state and federal health standards of below 0.010 mg/l. In 2013, two rounds of 5 samples for lead were taken. Of the ten samples taken for lead, seven showed the presence of lead. All samples met the state and federal standards. Mats View does not require anti-corrosion treatment for lead or copper. If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The PUD is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. If or when your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to 2 minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposure is available from Safe Drinking Water Hotline at 800-426-4791 or http://www.epa.gov/safewater/lead.
The table below lists all the drinking water contaminants that we detected during the 2018 calendar year. The presence of these contaminants in the water does not necessarily indicate that the water poses a health risk. Unless otherwise noted, the data presented in this table is from testing done January 1 - December 31, 2018. The state requires us to monitor for certain contaminants less than once per year because the concentrations of these contaminants are not expected to vary significantly from year to year. Some of the data, though representative of the water quality, is more than one year old.

Terms & abbreviations used below: Maximum Contaminant Level Goal (MCLG): the level of a contaminant in drinking water below which there is not known or expected risk to health. MCLGs allow for a margin of safety. Maximum Contaminant Level (MCL): the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology. Action Level (AL): the concentration of a contaminant which, when exceeded, triggers treatment or other requirements which a water system must follow. Maximum residual disinfectant level goal (MRDLG): the level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants. Maximum residual disinfectant level (MRDL): The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants. Treatment Technique (TT): A required process intended to reduce the level of a contaminant in drinking water if MCL is exceeded. N/a: not applicable; Nd: not detectable at testing limit ppb: parts per billion or micrograms per liter ppm: parts per million or milligrams per liter pCi/l: picocuries per liter (a measure of radiation); mg/L: milligrams per liter (same as ppm).

Notes: The system was tested for the presence/absence of total coliform bacteria every month in 2018, none detected. No additional testing was scheduled in 2018. You can search all our water test results at Washington Department of Health’s Sentry Database at https://fortress.wa.gov/doh/eh/portal/odw/si/. Search for “Mats View” and click on the “Samples” tab.
